

Lab Name:	Let's Add Clients to the Cluster
Section Number:	3
Lecture Number:	17

1. Provision your Nomad client nodes in a similar fashion as the server nodes. Be sure to think about the workloads that will run on the clients and size the client nodes appropriately.
2. Open `/etc/nomad.d/nomad.hcl` file and modify the client configuration (`basic_client.hcl`) based on the example shown in my GitHub – <https://btk.me/nomad>
3. Install Docker or any other requirements you need to run your workloads:

```
$ sudo amazon-linux-extras install docker -y
$ sudo service docker start
$ sudo systemctl enable docker
```

4. Start the Nomad service:

```
$ sudo systemctl start nomad
```

5. Validate you can view the Nomad servers:

```
$ nomad server members
```
